(54) **Use of trans-trans isomers of conjugated linoleic acid**

(57) CLA -isomer mixtures rich in trans/trans isomers were found to have excellent anti-inflammatory properties and can be used for these purposes in foods

or in food supplements, simultaneously these isomers improve the product performance of many food products.

BEST AVAILABLE COPY

EP 1 097 708 A1

Description

[0001] Conjugated linoleic acid is indicated in many literature references as a composition having a number of health benefits. In particular WARF filed many patent applications on these benefits.

[0002] Conjugated linoleic acid however is not a single compound, but consists of a great number of isomers. These isomers include isomers wherein the 2 double bonds have different positions in the fatty acid molecule, but also isomers based on cis/trans isomerism.

[0003] So far all references on conjugated linoleic acid strongly suggest that the health effects that are reported are due to the presence of at least a cis double bond in the system. In particular the cis⁹trans¹¹ and trans¹⁰cis¹² isomers are held responsible for the beneficial effects. This can be concluded from eg. the following documents: WO 99/29317; WO 96/34855 but also from scientific publications such as, Poultry Science 72 (1993) p.1301-1305 or J Lipid Research 40 (1999) p.1426 - 33 or Lipids 33 (5) 1998, p.521-7. In contrast, Lipids 34 (3), 1999, p.235 -41, shows that trans⁹trans¹¹ CLA has no biological effect at all.

[0004] We studied whether these effects really are due to the isomers mentioned above or whether other isomers from CLA either contribute to these known effects or display novel effects. This study resulted in the surprising finding that in in-vitro tests, in particular the tt-CLA compounds (ie conjugated linoleic acid isomers wherein all bonds are trans double bonds) have beneficial properties, in particular anti-inflammatory properties. Moreover we found that a tt CLA isomer mixture containing predominantly trans⁹trans¹¹ and trans¹⁰trans¹² isomers displayed the strongest biological effect.

[0005] Therefore our invention concerns in the first instance the use of a composition comprising 1 to 100, preferably 5 to 90, most preferably 20 to 85 wt% (based on total composition) of isomers of trans/trans conjugated linoleic acid (=tt-CLA) as measured by ¹³C-magnetic resonance, wherein the tt-CLA is applied as an anti-inflammatory agent.

[0006] According to another embodiment of our invention these compositions can be applied as an additive in a food product or as a food supplement, preferably in encapsulated form in order to provide these products with anti-inflammatory properties. The use of these tt-rich CLA compositions simultaneously was found to result in an improvement of the physical properties, such as improved hardness, texture, firmness and overrun of food products.

[0007] The mouthfeel, oral meltdown and flavour release are not negatively affected by the tt-CLA. In addition, the products are easier to process and have better aeration properties.

[0008] It is preferred that the tt-CLA compositions according to the invention have a high relative tt-CLA content. Therefore we prefer to use a composition, that comprises the tt-CLA isomers as measured by ¹³C magnetic resonance techniques in amounts of 5 to 90 wt% (on total composition), while the CLA isomers cis⁹trans¹¹ and trans¹⁰cis¹² are present in a weight ratio of:

(t⁹t¹¹+t¹⁰t¹²): (c⁹t¹¹ + t¹⁰c¹²) of more than 3:1, preferably more than 5:1, most preferably more than 7.5:1.

[0009] The ¹³C magnetic resonance technique for the determination of the isomer distribution in the CLA is known from Davis, A.L. et al Chemistry and physics of Lipids, 97, (1999) p.155-65.

[0010] The tt-rich CLA mixtures that can be applied according to the invention can be selected from free fatty acids, mono-, di- or triglycerides and alkylesters from CLA.

[0011] Although tt-CLA always will be produced in some (minor) amounts during the production of CLA isomer mixtures it would be very beneficial if concentrates would be available, as these would ease the dosing into foods and in particular would enable to make effective food supplements. Therefore we studied whether we could obtain concentrates of tt-CLA. This study resulted in another embodiment of our invention ie. in compositions with anti-inflammatory properties comprising CLA isomers, wherein the composition comprises more than 10 wt%, preferably more than 25 wt%, most preferably more than 50 wt% of CLA-isomers from which more than 55, preferably more than 60, most preferably more than 65 wt% (on total of CLA isomers) are tt-CLA isomers as measured by ¹³C-magnetic resonance techniques.

[0012] Preferred compositions that we obtained are compositions, wherein the tt-CLA isomers t⁹t¹¹ and t¹⁰t¹² are present in a weight ratio t⁹t¹¹:t¹⁰t¹² of less than 2.3:1, preferably less than 1.8:1, most preferably less than 1.0:1 (as measured by ¹³C magnetic resonance techniques).

[0013] Other preferred compositions comprise in addition to the tt-isomers c⁹t¹¹-and t¹⁰c¹²-CLA isomers in a weight ratio of (total t⁹t¹¹ + t¹⁰t¹²): (c⁹t¹¹ + t¹⁰c¹²) of more than 3:1, preferably more than 5:1, most preferably more than 7.5:1 as measured by ¹³C-magnetic resonance technology.

[0014] The tt-CLA composition according to the invention can suitably be applied in food products. Although the tt-CLA compositions could be present in any form (ie free acid / glycerides / alkylesters with alkyl groups with 2-20, preferably 2-8 carbon atoms) we prefer to use these compositions as glycerides because in that way the best oral mouthfeel properties of the food can be achieved.

[0015] Part of our invention therefore also are food products, preferably selected from the group consisting of confectionery products, spreads, sauces, dressings, mayonnaise, cheese, ice cream, doughs, baked bakery products, fillings and creams containing an effective amount of a composition comprising 1 to 100 wt% of tt-CLA, preferably in

the form of a mono- and/or di- and/or triglyceride. Most preferred are food products containing an effective amount of the preferred CLA-composition as defined above. An effective amount is defined as that amount, that corresponds with the recommended daily amount as achievable in 1-5 foodservices per day.

[0016] A very convenient method to administer an effective dose of our tt-CLA to the users is by providing our users with food supplements containing an effective dose of the tt-CLA. Therefore part of our invention is also food supplements, wherein the tt-rich CLA is encapsulated in a food grade encapsulating material, such as sugar, lactose, starch, modified starch, gelatine, cyclodextrin, proteins and cellulose.

[0017] The food supplements can also be fortified with other food ingredients. These ingredients can be selected from the group consisting of vitamins A, B, C, D, E, K, minerals such as calcium, potassium, magnesium, iron, copper, zinc, selenium and anti-oxidants such as tocopherols, polyphenols.

[0018] The tt-rich CLA isomer composition can be made by a process

i) wherein a composition with a total unconjugated C18:2 content of more than 55 wt% is conjugated and isomerized subjecting it to a catalytic treatment with a Sulphur-Nickel catalyst at a temperature of 100 to 180 °C in the absence of hydrogen

ii) the product formed in step i) is subjected to a solvent fractionation using acetone in a weight ratio of acetone to CLA product of 10:1 to 1:1 at a temperature of -25 to -100 °C, whereupon a stearine (or top) fraction is isolated as product according to the invention.

[0019] An alternative process for making these compositions comprises an enrichment of a mixture comprising different isomers of conjugated linoleic acid in the tt-CLA isomers wherein a mixture comprising at least 1 wt% of tt-CLA in admixture with other CLA isomers is subjected to an enzymic conversion, selected from the group consisting of i) partial hydrolysis of a glyceride mixture or of a mixture of esters of short chain alcohols, ii) partial esterification of a mixture of free fatty acids with glycerol or with a glyceride, iii) partial glycerolysis of a glyceride mixture and iv) partial esterification of an alcohol with free CLA isomers, while using an enzyme that can discriminate tt-CLA from other CLA isomers, whereupon the reaction product is separated by physical means separating a fraction that is enriched in tt-CLA as reaction product.

[0020] Enzymes that can be applied in above process can be selected from the group consisting of *Candida rugosa* lipase; Lipase QL; Lipase SL, Lipase OF and *Geotrichum candidum* B lipase, Lipozyme IM, Lipozyme M.

[0021] According to another alternative process, as illustrated in example 4, tt-CLA can be made effectively by subjecting a mixture of CLA isomers (obtained by base treatment of an oil, rich in linoleic acid in propylene glycol) to microwaves. It was found that microwaving during 3-10 min using 700-900 watts already resulted in high conversion rates to tt-CLA.

EXPERIMENTAL PART

[0022] The anti-inflammatory effects were determined by *in vitro* tests wherein the production Prostaglandin E2 (=PGE2) by the human skin fibroblasts, blood vessel endothelial cells (HUVECS=Human Umbilical Vein Endothelial Cells) and blood is measured following stimulation by the inflammatory modulus PMA. A reduction of the levels of PGE2 is indicative for the anti-inflammatory effect.

[0023] Primary human foreskin fibroblasts at passage 2 (P2) were seeded into 96-well plates at 10000 cells/well and maintained for 24 hours in an atmosphere of 5% carbon dioxide in Dulbeccos Modified Eagles Medium (DMEM) supplemented with 10% foetal calf serum. Enriched tt-CLA (containing 84 wt% of tt-CLA and having a ratio (t⁹t¹¹+t¹⁰t¹²) : (c⁹t¹¹ +t¹⁰c¹²) of 15 was added to fresh cell media in ethanol (final concentration 1%) in triplicate and incubated for a further 24 hours. Phorbol myristate acetate (PMA, Sigma) in ethanol/cell media was added to the media (final concentration 10nm) and the cells incubated for a further 24 hours. PMA represents an external stressor which induces oxidative stress and inflammatory responses in cells. The media was then analysed immediately as described below.

[0024] **Prostaglandin E2 (PGE2) assay** Volumes of 50 µl culture medium were taken for PGE2 assay after gently shaking the culture plate. PGE2 levels in the medium were determined with a Biotrak PGE2 immunoassay kit (Amersham, UK). The assay is based on the competition between unlabelled PGE2 in the sample and a fixed quantity of horseradish peroxidase labelled PGE2 for a limited amount of fixed PGE2 specific antibody. Concentrations of unlabelled sample PGE2 were determined according to a standard curve which was obtained at the same time.

Results:

[0025] The below graph (Fig 1) demonstrates that challenging cells with an inflammatory stimulus such as PMA (Phorbol myristyl acetate) causes an increase in the inflammatory response as measured by prostaglandin E2 (PGE2) production. ttCLA, even at the levels of 10ng/ml, dramatically reduces the inflammatory response as measured by

PGE2 production (Fig. 1) .
- good anti-inflammatory activity.

Example 1

[0026] 10g of sunflower oil were mixed with 1g of sulphur poisoned nickel hydrogenation catalyst. The mixture was stirred under a blanket of nitrogen at 180 °C in a glass vessel equipped with a magnetic stirrer.

[0027] After 6 hours a sample was removed extracted with a suitable solvent and filtered. The fatty acid composition of the triglyceride, as determined by FAME GC, contained 45% conjugated linoleic acid (CLA) of which 50% was tt CLA. The major tt isomers, determined by ¹³C NMR, were trans⁹trans¹¹ and trans¹⁰trans¹² which together represented 60% of the total tt CLA.

Example 2

[0028] Conjugated linoleic acid was produced as described in example 1. An enriched product was made according to the following procedure. 5g of CLA was added to 30g of acetone in a stirred glass vessel and the temperature slowly reduced to -58 °C. The stearine fraction was isolated by vacuum filtration and washed with pre-cooled acetone. The fatty acid composition, determined by ¹³C-NMR, contained 33% CLA of which 86.6% was tt CLA. The major tt isomers, determined by ¹³C NMR, were trans⁹trans¹¹ and trans¹⁰trans¹² which together represented 67% of the total tt CLA. This product was tested in above test on anti-inflammatory properties.

Example 3

[0029] Conjugated linoleic acid was produced by alkali isomerisation as described previously, W09718320, to give a product that contained 80% CLA. The two main isomers, determined by FAME GC, were cis⁹trans¹¹ and trans¹⁰cis¹² which together represented 95% of the total CLA.

[0030] 20g of this material was heated to 250 °C for 4 hours under a blanket of nitrogen. The fatty acid composition, determined by FAME GC, contained 67% CLA of which 30% was tt.

Example 4

[0031] 10.8 g of propylene glycol were stirred with 3.97 g of a 50 % aqueous KOH solution. The mixture was warmed to a temperature of 85 °C. 5.4 g of sunflower oil were added to this mixture and the mixture was stirred for 30 min. The mixture so obtained was placed in a microwave oven (Panasonic type NN5252B, 2450 MHz) and was subjected to microwaving at 850 Watts for 5.5 min. The mixture was cooled to 80 °C and 50 ml of diluted sulphuric acid (1:10) were added. The pH of the water layer was less than 3. The upperlayer was removed and washed with distilled water until neutral. The oil obtained was dried under vacuum. The FAME of the oil so obtained was:

C14:0	0.15 %
C16:0	3.95
C18:0	1.55
C18:1t	0.42
C18:1c	21.43
C18:2tt,ct	2.97
CLA 9c11t	6.59
CLA 11,13	4.32
CLA 10t12c	5.49
CLA tt	36.50
Balance other fatty acids.	

[0032] Thus the conjugation of the linoleic acid was about complete whereas from the CLA formed about 59 % was tt-CLA.

Example 5

[0033] Conjugated linoleic acid was produced as described in example 1. An enriched product was made by adding

2 g of this CLA to 2 g of water and 3,000 LU of lipase B from *Geotrichum candidum*. The mixture was stirred and maintained at 35 °C. The fatty acid composition of the glycerides as determined by FAME GC contained 50 wt% of CLA of which 57 % was tt CLA.

5 Definitions for products used in examples 6 and 7

[0034]

InES: Interesterified palm oil stearin/palmkernel stearin fat
 Pof IV65 : Palm olein fraction with Iodine Value 65
 SF : Sunflower oil
 tt CLA : tt CLA containing oil
 CN : Coconut oil

15 Example 6 Preparation of margarine

a) Formulation

[0035]

Aqueous Phase	
Water	18.48%
Potassium Sorbate	0.15
Citric Acid	0.07
SMP	1.0

Fat Phase	
Fat Blend	80.0
Hymono 8903	0.3

Fat Phase: - Product 1. 12% InEs, 88% SF (Control)
 Product 2. 12% InEs, 10% tt CLA, 78% SF

b) Process Conditions

[0036] The process line was configured as: -

Premix - Pump - A₁-unit - C₁-unit - A₂-unit

Premix temperature was set at 60°C and 60-rpm stirrer speed. All units were set to 15°C, with shaft speeds set to 1000 rpm. Throughput was 50 g/min. using the constant displacement pump.

[0037] For all products a coarse premix was prepared by slowly adding the prepared aqueous phase to the oil phase in the premix tank. A 2 kg-batch was employed.

The mix was stirred for 15 minutes before pumping. After pumping the line was allowed to run for 15 minutes before any collection of product.

[0038] The following process parameters were noted: -

Product	A ₁ exit (°C)	C ₁ exit (°C)	A ₂ exit (°C)	Line Pressure (bar)
Control	20.2	19.4	17.6	1.0
10% tt CLA	21.4	20.2	18.0	1.4

[0039] All tubs were placed at 5°C. After one day, one tub of each was transferred to each of 5°, 10°, 15° and 20°C for evaluations after one week.

[0040] All samples spread easily with no apparent water loss. All products are of excellent quality and displayed very good values for hardness (C-value), collar and conductivity at all storage temperatures (5, 10, 15 and 20°C).

5°C Storage

[0041]

Sample	C-Value (g/cm ²)	Collar (Scale I to VI)	Conductivity (μS·cm ⁻¹)
Control	630	I/II	<10 ⁻⁵

Example 7 Preparation of ice cream

[0045]

Table 1:

Recipe	
The following recipe was applied (cf table 1)	
Component	Wt%
Fat blend	10.0
Skimmed milk powder	10.0
Crystal sugar	12.0
Clear syrup	4.0
Dextrose anhydrate	2
Dimodan PVP	0.6
Water	61.4

[0046] The fat blends that were used are disclosed in table 2

Table 2:

Fat blend		
	Component	Wt%
Reference	POf IV65/ CN/ SF	30/20/50
Sample	POf IV65/CN/CLA tt containing oil	30/20/50

[0047] The sugar, milk powder and dextrose were mixed and added to the water. The mixture was heated to 70°C and the clear syrup was added. Next the fat blend and the emulsifier were added. The emulsion was stirred with an ultra-turrax, cooled down to 20°C and stirred again with the ultra-turrax. The emulsion stayed overnight in the refrigerator at 7°C. The batch ice cream machine was held for 24 hours at -28°C. The emulsion was stirred in the machine for 40 minutes until the temperature was at its lowest. The resulting ice cream was stored at -18°C for at least 3 days and was then evaluated.

[0048] From table 3 it can be concluded that the products according to the invention displayed a better hardness and a higher overrun.

Table 3:

	Reference	Product with CLA t,t
Overrun in %	6.7	14.4
hardness	52	173

Taste panel

[0049] Seven panellist tasted the firmness of sample in comparison to the reference. For 5 out of seven the sample with CLA t,t had a higher firmness.

1. Reference with SF - CLA tt			
	less/slower	equal	more/faster

Claims

1. Use of a composition comprising 1 to 100, preferably 5 to 90, most preferably 20 to 85 wt% (on total composition) of isomers of trans/trans conjugated linoleic acid (=tt-CLA) as measured by ¹³C-magnetic resonance, wherein the tt-CLA is applied as anti-inflammatory agent.
2. Use of a composition according to claim 1 wherein the composition, comprising the tt-CLA is applied as an additive in a food product or as food supplement, preferably in encapsulated form.
3. Use of a composition according to claims 1 and 2 wherein the composition, comprising the tt-CLA isomers contains as measured by ¹³C magnetic resonance techniques 5 to 90 wt% (on total composition) of tt-CLA, while also the CLA isomers cis⁹trans¹¹ and trans¹⁰cis¹² are present in a weight ratio of (total t⁹t¹¹+t¹⁰t¹²) to (c⁹t¹¹+t¹⁰c¹²) of more than 3:1, preferably more than 5:1, most preferably more than 7.5:1.
4. Use of a composition according to claims 1 to 3 wherein the tt-CLA isomers are present either as free fatty acids, or as mono-, di-, and/or triglycerides or as alkylesters.
5. Composition with anti-inflammatory properties comprising CLA isomers, wherein the composition comprises more than 10 wt%, preferably more than 25 wt%, most preferably more than 50 wt% of CLA-isomers, from which more than 55, preferably more than 60, most preferably more than 65 wt% (on total CLA isomers) are tt-CLA isomers as measured by ¹³C-magnetic resonance techniques.

6. Composition with anti inflammatory properties according to claim 5, wherein the composition comprises the tt-CLA isomers t^9t^{11} and $t^{10}t^{12}$ in a weight ratio t^9t^{11} to $t^{10}t^{12}$ of less than 2.3:1, preferably less than 1.8:1, most preferably less than 1.0:1 (as measures by ^{13}C magnetic resonance techniques).

7. Composition according to claims 5 or 6 wherein the composition also contains c^9t^{11} and $t^{10}c^{12}$ -CLA isomers in a weight ratio of (total $t^9t^{11}+t^{10}t^{12}$) to ($c^9t^{11}+t^{10}c^{12}$) of more than 3:1, preferable more than 5:1, most preferable more than 7.5:1 as measured by ^{13}C -magnetic resonance technology.

8. Food products, preferably selected from the group consisting of confectionery products, spreads, sauces, dressings, mayonnaise, cheese, ice cream, doughs, baked bakery products, fillings, creams containing an effective amount of a composition comprising 1 to 100 wt% of tt-CLA, preferably in the form of a mono- and/or di- and/or triglyceride and most preferably containing an effective amount of the composition according to claims 5 to 7.

9. Food supplements containing an effective amount of a composition comprising 1 to 100 wt% of tt-CLA, preferably containing an effective amount of a composition according to claims 5 to 7.

10. Food supplements according to claim 9 wherein the tt-CLA rich composition is encapsulated in a food grade encapsulating material.

11. Food supplement according to claims 9 to 10 wherein the composition comprising the tt-CLA is fortified with other food ingredients selected from the group consisting of vitamins A, B, C, D, E, K, minerals such as calcium, potassium, magnesium, iron, copper, zinc, selenium and anti-oxidants such as tocopherols, polyphenols.

12. Process for the preparation of a composition according to claims 5 to 7, wherein:

i) a composition with a total unconjugated C18:2 content of more than 55 wt% is conjugated and isomerized by subjecting it to a catalytic treatment with a Sulphur-Nickel catalyst at a temperature of 100 to 180 °C in the absence of hydrogen

ii) the product formed in step i) is subjected to a solvent fractionation using acetone in a weight ratio of acetone to CLA product of 10:1 to 1:1 at a temperature of -25 to -100 °C, whereupon a stearine (or top) fraction is isolated as product according to claims 5 to 6.

13. Process for the enrichment of a mixture comprising different isomers of conjugated linoleic acid in the tt-CLA isomers wherein a mixture comprising at least 1 wt% of tt-CLA in admixture with other CLA isomers is subjected to an enzymic conversion, selected from the group consisting of i) partial hydrolysis of a glyceride mixture or of a mixture of esters of short chain alcohols, ii) partial esterification of a mixture of free fatty acids with glycerol or with a glyceride, iii) partial glycerolysis of a glyceride mixture and iv) partial esterification of an alcohol with free CLA isomers, while using an enzyme that can discriminate tt-CLA from other CLA isomers, whereupon the reaction product is separated by physical means separating a fraction that is enriched in tt-CLA as reaction product.

14. Process according to claim 13 wherein the enzyme is selected from the group consisting of: *Candida rugosa* lipase, Lipase QL, Lipase SL, Lipase OF, *Geotrichum candidum* B lipase, Lipozyme IM and lipozyme M.

Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description

[0001] Conjugated linoleic acid is indicated in many literature references as a composition having a number of health benefits. In particular WARF filed many patent applications on these benefits.

[0002] Conjugated linoleic acid however is not a single compound, but consists of a great number of isomers. These isomers include isomers wherein the 2 double bonds have different positions in the fatty acid molecule, but also isomers based on cis/trans isomerism.

[0003] So far all references on conjugated linoleic acid strongly suggest that the health effects that are reported are due to the presence of at least a cis double bond in the system. In particular the cis⁹trans¹¹ and trans¹⁰cis¹² isomers are held responsible for the beneficial effects. This can be concluded from eg. the following documents: WO 99/29317; WO 96/34855 but also from scientific publications such as, Poultry Science 72 (1993) p.1301-1305 or J Lipid Research 40 (1999) p.1426 - 33 or Lipids 33 (5) 1998, p.521-7. In contrast, Lipids 34 (3), 1999, p.235 -41, shows that trans⁹trans¹¹ CLA has no biological effect at all.

[0004] We studied whether these effects really are due to the isomers mentioned above or whether other isomers from CLA either contribute to these known effects or display novel effects. This study resulted in the surprising finding that in in-vitro tests, in particular the tt-CLA compounds (ie conjugated linoleic acid isomers wherein all bonds are trans double bonds) have beneficial properties, in particular anti-inflammatory properties. Moreover we found that a tt CLA isomer mixture containing predominantly trans⁹trans¹¹ and trans¹⁰trans¹² isomers displayed the strongest biological effect.

[0005] Therefore our invention concerns in the first instance the use of a composition for the production of a food product or food supplement wherein a composition comprising 1 to 100, preferably 5 to 90, most preferably 20 to 85 wt % (based on total composition) of isomers of trans/trans conjugated linoleic acid (=tt-CLA) as measured by ¹³C-magnetic resonance, wherein the tt-CLA is applied for the production of a food product or food supplement with anti-inflammatory properties.

[0006] According to another embodiment of our invention these compositions can be applied as an additive in a food product or as a food supplement, preferably in encapsulated form in order to provide these products with anti-inflammatory properties. The use of these tt-rich CLA compositions simultaneously was found to result in an improvement of the physical properties, such as improved hardness, texture, firmness and overrun of food products.

[0007] The mouthfeel, oral meltdown and flavour release are not negatively affected by the tt-CLA. In addition, the products are easier to process and have better aeration properties.

[0008] It is preferred that the tt-CLA compositions according to the invention have a high relative tt-CLA content. Therefore we prefer to use a composition, that comprises the tt-CLA isomers as measured by ¹³C magnetic resonance techniques in amounts of 5 to 90 wt% (on total composition), while the CLA isomers cis⁹trans¹¹ and trans¹⁰cis¹² are present in a weight ratio of: (t⁹t¹¹+t¹⁰t¹²): (c⁹ t¹¹ +t¹⁰ c¹²) of more than 3:1, preferably more than 5:1, most preferably more than 7.5:1.

[0009] The ¹³C magnetic resonance technique for the determination of the isomer distribution in the CLA is known from Davis, A.L. et al Chemistry and physics of Lipids, 97, (1999) p.155-65.

[0010] The tt-rich CLA mixtures that can be applied according to the invention can be selected from free fatty acids, mono-, di- or triglycerides and alkylesters from CLA.

[0011] Although tt-CLA always will be produced in some (minor) amounts during the production of CLA isomer mixtures it would be very beneficial if concentrates would be available, as these would ease the dosing into foods and in particular would enable to make effective food supplements. Therefore we studied whether we could obtain concentrates of tt-CLA. This study resulted in another embodiment of our invention ie. in compositions with anti-inflammatory properties comprising CLA isomers, wherein the composition comprises more than 10 wt%, preferably more than 25 wt%, most preferably more than 50 wt% of CLA-isomers from which more than 55, preferably more than 60, most preferably more than 65 wt% (on total of CLA isomers) are tt-CLA isomers as measured by ¹³C-magnetic resonance techniques.

Preferred compositions that we obtained are compositions, wherein the tt-CLA isomers t⁹t¹¹ and t¹⁰t¹² are present in a weight ratio t⁹t¹¹:t¹⁰t¹² of less than 2.3:1, preferably less than 1.8:1, most preferably less than 1.0:1 (as measured by ¹³C magnetic resonance techniques).

[0012] Other preferred compositions comprise in addition to the tt-isomers c⁹t¹¹-and t¹⁰c¹²-CLA isomers in a weight ratio of (total t⁹t¹¹ + t¹⁰t¹²): (c⁹t¹¹ + t¹⁰c¹²) of more than 3:1, preferably more than 5:1, most preferably more than 7.5:1 as measured by ¹³C-magnetic resonance technology.

[0013] The tt-CLA composition according to the invention can suitably be applied in food products. Although the tt-CLA compositions could be present in any form (ie free acid / glycerides / alkylesters with alkyl groups with 2-20, preferably 2-8 carbon atoms) we prefer to use these compositions as glycerides because in that way the best oral mouthfeel properties of the food can be achieved.

[0014] Part of our invention therefore also are food products, preferably selected from the group consisting of con-

fectionery products, spreads, sauces, dressings, mayonnaise, cheese, ice cream, doughs, baked bakery products, fillings and creams containing an effective amount of a composition comprising 1 to 100 wt% of tt-CLA, preferably in the form of a mono- and/or di- and/or triglyceride. Most preferred are food products containing an effective amount of the preferred CLA-composition as defined above. An effective amount is defined as that amount, that corresponds with the recommended daily amount as achievable in 1-5 foodservices per day.

[0015] A very convenient method to administer an effective dose of our tt-CLA to the users is by providing our users with food supplements containing an effective dose of the tt-CLA. Therefore part of our invention is also food supplements, wherein the tt-rich CLA is encapsulated in a food grade encapsulating material, such as sugar, lactose, starch, modified starch, gelatine, cyclodextrin, proteins and cellulose.

[0016] The food supplements can also be fortified with other food ingredients. These ingredients can be selected from the group consisting of vitamins A, B, C, D, E, K, minerals such as calcium, potassium, magnesium, iron, copper, zinc, selenium and anti-oxidants such as tocopherols, polyphenols.

[0017] The tt-rich CLA isomer composition can be made by a process

i) wherein a composition with a total unconjugated C18:2 content of more than 55 wt% is conjugated and isomerized subjecting it to a catalytic treatment with a Sulphur-Nickel catalyst at a temperature of 100 to 180 °C in the absence of hydrogen

ii) the product formed in step i) is subjected to a solvent fractionation using acetone in a weight ratio of acetone to CLA product of 10:1 to 1:1 at a temperature of -25 to -100 °C, whereupon a stearine (or top) fraction is isolated as product according to the invention.

[0018] An alternative process for making these compositions comprises an enrichment of a mixture comprising different isomers of conjugated linoleic acid in the tt-CLA isomers wherein a mixture comprising at least 1 wt% of tt-CLA in admixture with other CLA isomers is subjected to an enzymic conversion, selected from the group consisting of i) partial hydrolysis of a glyceride mixture or of a mixture of esters of short chain alcohols, ii) partial esterification of a mixture of free fatty acids with glycerol or with a glyceride, iii) partial glycerolysis of a glyceride mixture and iv) partial esterification of an alcohol with free CLA isomers, while using an enzyme that can discriminate tt-CLA from other CLA isomers, whereupon the reaction product is separated by physical means separating a fraction that is enriched in tt-CLA as reaction product.

[0019] Enzymes that can be applied in above process can be selected from the group consisting of *Candida rugosa* lipase; Lipase QL; Lipase SL, Lipase OF and *Geotrichum candidum* B lipase, Lipozyme IM, Lipozyme M.

EXPERIMENTAL PART

[0020] The anti-inflammatory effects were determined by *in vitro* tests wherein the production Prostaglandin E2 (=PGE2) by the human skin fibroblasts, blood vessel endothelial cells (HUVECS=Human Umbilical Vein Endothelial Cells) and blood is measured following stimulation by the inflammatory modulus PMA. A reduction of the levels of PGE2 is indicative for the anti-inflammatory effect.

[0021] Primary human foreskin fibroblasts at passage 2 (P2) were seeded into 96-well plates at 10000 cells/well and maintained for 24 hours in an atmosphere of 5% carbon dioxide in Dulbeccos Modified Eagles Medium (DMEM) 5 supplemented with 10% foetal calf serum. Enriched tt-CLA (containing 84 wt% of tt-CLA and having a ratio ($t^9t^{11}+t^{10}t^{12}$): ($c^9t^{11}+t^{10}c^{12}$) of 15 was added to fresh cell media in ethanol (final concentration 1%) in triplicate and incubated for a further 24 hours. Phorbol myristate acetate (PMA, Sigma) in ethanol/cell media was added to the media (final concentration 10nm) and the cells incubated for a further 24 hours. PMA represents an external stressor which induces oxidative stress and inflammatory responses in cells. The media was then analysed immediately as described below.

[0022] **Prostaglandin E2 (PGE2) assay** Volumes of 50 µl culture medium were taken for PGE2 assay after gently shaking the culture plate. PGE2 levels in the medium were determined with a Biotrak PGE2 immunoassay kit (Amersham, UK). The assay is based on the competition between unlabelled PGE2 in the sample and a fixed quantity of horseradish peroxidase labelled PGE2 for a limited amount of fixed PGE2 specific antibody. Concentrations of unlabelled sample PGE2 were determined according to a standard curve which was obtained at the same time.

Results:

[0023] The below graph (Fig 1) demonstrates that challenging cells with an inflammatory stimulus such as PMA (Phorbol myristyl acetate) causes an increase in the inflammatory response as measured by prostaglandin E2 (PGE2) production. ttCLA, even at the levels of 10ng/ml, dramatically reduces the inflammatory response as measured by PGE2 production (Fig. 1).

- good anti-inflammatory activity.

Example 1

[0024] 10g of sunflower oil were mixed with 1g of sulphur poisoned nickel hydrogenation catalyst. The mixture was stirred under a blanket of nitrogen at 180 °C in a glass vessel equipped with a magnetic stirrer.

[0025] After 6 hours a sample was removed extracted with a suitable solvent and filtered. The fatty acid composition of the triglyceride, as determined by FAME GC, contained 45% conjugated linoleic acid (CLA) of which 50% was tt CLA. The major tt isomers, determined by ¹³C NMR, were trans⁹trans¹¹ and trans¹⁰trans¹² which together represented 60% of the total tt CLA.

Example 2

[0026] Conjugated linoleic acid was produced as described in example 1. An enriched product was made according to the following procedure. 5g of CLA was added to 30g of acetone in a stirred glass vessel and the temperature slowly reduced to -58 °C. The stearine fraction was isolated by vacuum filtration and washed with pre-cooled acetone. The fatty acid composition, determined by ¹³C-NMR, contained 33% CLA of which 86.6% was tt CLA. The major tt isomers, determined by ¹³C NMR, were trans⁹trans¹¹ and trans¹⁰trans¹² which together represented 67% of the total tt CLA. This product was tested in above test on anti-inflammatory properties.

Example 3

[0027] Conjugated linoleic acid was produced by alkali isomerisation as described previously, W09718320, to give a product that contained 80% CLA. The two main isomers, determined by FAME GC, were cis⁹trans¹¹ and trans ¹⁰cis¹² which together represented 95% of the total CLA.

[0028] 20g of this material was heated to 250 °C for 4 hours under a blanket of nitrogen. The fatty acid composition, determined by FAME GC, contained 67% CLA of which 30% was tt.

Example 5

[0029] Conjugated linoleic acid was produced as described in example 1. An enriched product was made by adding 2 g of this CLA to 2 g of water and 3,000 LU of lipase B from *Geotrichum candidum*. The mixture was stirred and maintained at 35 °C. The fatty acid composition of the glycerides as determined by FAME GC contained 50 wt% of CLA of which 57 % was tt CLA.

[0030] Definitions for products used in examples 6 and 7

InES: Interesterified palm oil stearin/palmkernel stearin fat

Pof IV65 : Palm olein fraction with Iodine Value 65

SF : Sunflower oil

tt CLA : tt CLA containing oil

CN : Coconut oil

Example 6 Preparation of margarine

a) Formulation

[0031]

Aqueous Phase	
Water	18.48%
Potassium Sorbate	0.15
Citric Acid	0.07
SMP	1.0
Fat Phase	
Fat Blend	80.0

(continued)

Fat Phase	
Hymono 8903	0.3

Fat Phase: -Product 1. 12% InEs, 88% SF (Control)

Product 2. 12% InEs, 10% tt CLA, 78% SF

b) Process Conditions

[0032] The process line was configured as: -

Premix - Pump - A₁-unit - C₁-unit - A₂-unit

[0033] Premix temperature was set at 60°C and 60-rpm stirrer speed. All units were set to 15°C, with shaft speeds set to 1000 rpm. Throughput was 50 g/min. using the constant displacement pump.

[0034] For all products a coarse premix was prepared by slowly adding the prepared aqueous phase to the oil phase in the premix tank. A 2 kg-batch was employed.

The mix was stirred for 15 minutes before pumping. After pumping the line was allowed to run for 15 minutes before any collection of product.

[0035] The following process parameters were noted: -

Product	A ₁ exit (°C)	C ₁ exit (°C)	A ₂ exit (°C)	Line Pressure (bar)
Control	20.2	19.4	17.6	1.0
10% tt CLA	21.4	20.2	18.0	1.4

[0036] All tubs were placed at 5°C. After one day, one tub of each was transferred to each of 5°, 10°, 15° and 20°C for evaluations after one week.

[0037] All samples spread easily with no apparent water loss. All products are of excellent quality and displayed very good values for hardness (C-value), collar and conductivity at all storage temperatures (5, 10, 15 and 20°C).

5°C Storage

[0038]

Sample	C-Value (g/cm ²)	Collar (Scale I to VI)	Conductivity (μS·cm ⁻¹)
Control	630	I/II	<10 ⁻⁵
10% tt CLA	610	I/II	<10 ⁻⁵

10° Storage

[0039]

Sample	C-Value (g/cm ²)	Collar (Scale I to VI)	Conductivity (μS·cm ⁻¹)
Control	410	I	<10 ⁻⁵

Control	340	I	<10 ⁻⁵
10% tt CLA	390	I	<10 ⁻⁵

20°C Storage

[0041]

Sample	C-Value (g/cm ²)	Collar (Scale I to VI)	Conductivity (μScm ⁻¹)
Control	300	I	<10 ⁻⁵
10% tt CLA	280	I	<10 ⁻⁵

Example 7 Preparation of ice cream

[0042]

Table 1:

Recipe	
The following recipe was applied (cf table 1)	
Component	Wt%
Fat blend	10.0
Skimmed milk powder	10.0
Crystal sugar	12.0
Clear syrup	4.0
Dextrose anhydrate	2
Dimodan PVP	0.6
Water	61.4

[0043] The fat blends that were used are disclosed in table 2

Table 2:

Fat blend		
	Component	Wt%
Reference	POf IV65/ CN/ SF	30/20/50
Sample	POf IV65/CN/CLA tt containing oil	30/20/50

[0044] The sugar, milk powder and dextrose were mixed and added to the water. The mixture was heated to 70°C and the clear syrup was added. Next the fat blend and the emulsifier were added. The emulsion was stirred with an ultra-turrax, cooled down to 20°C and stirred again with the ultra-turrax. The emulsion stayed overnight in the refrigerator at 7°C. The batch ice cream machine was held for 24 hours at -28°C. The emulsion was stirred in the machine for 40 minutes until the temperature was at its lowest. The resulting ice cream was stored at -18°C for at least 3 days and was then evaluated.

[0045] From table 3 it can be concluded that the products according to the invention displayed a better hardness and a higher overrun.

Table 3:

	Reference	Product with CLA t,t
Overrun in %	6.7	14.4
hardness	52	173

Taste panel

[0046] Seven panellist tasted the firmness of sample in comparison to the reference. For 5 out of seven the sample with CLA t,t had a higher firmness.

1. Reference with SF - CLA tt

[0047]

Firmness		2	5

Claims

1. Use of a composition for the production of a food product or a food supplement wherein a composition comprising 1 to 100, preferably 5 to 90, most preferably 20 to 85 wt% (on total composition) of isomers of trans/trans conjugated linoleic acid (=tt-CLA) as measured by ^{13}C -magnetic resonance is applied for the production of a food product or a food supplement with anti-inflammatory properties.
2. Use of a composition according to claim 1 wherein the composition, comprising the tt-CLA is applied for the production of a food supplement in encapsulated form.
3. Use of a composition according to claims 1 and 2 wherein the composition, comprising the tt-CLA isomers contains as measured by ^{13}C magnetic resonance techniques 5 to 90 wt% (on total composition) of tt-CLA, while also the CLA isomers cis⁹ trans¹¹ and trans¹⁰ cis¹² are present in a weight ratio of (total t⁹t¹¹+t¹⁰t¹²) to (c⁹t¹¹+t¹⁰c¹²) of more than 3:1, preferably more than 5:1, most preferably more than 7.5:1.
4. Use of a composition according to claims 1 to 3 wherein the tt-CLA isomers are applied either as free fatty acids, or as mono-, di-, and/or triglycerides or as alkylesters.
5. Composition with anti-inflammatory properties comprising CLA isomers, wherein the composition comprises more than 10 wt%, preferably more than 25 wt%, most preferably more than 50 wt% of CLA-isomers, from which more than 55, preferably more than 60, most preferably more than 65 wt% (on total CLA isomers) are tt-CLA isomers as measured by ^{13}C -magnetic resonance techniques.
6. Composition with anti inflammatory properties according to claim 5, wherein the composition comprises the tt-CLA isomers t⁹t¹¹ and t¹⁰t¹² in a weight ratio t⁹t¹¹ to t¹⁰t¹² of less than 2.3:1, preferably less than 1.8:1, most preferably less than 1.0:1 (as measures by ^{13}C magnetic resonance techniques).
7. Composition according to claims 5 or 6 wherein the composition also contains c⁹t¹¹ and t¹⁰c¹²-CLA isomers in a weight ratio of (total t⁹t¹¹+t¹⁰t¹²) to (c⁹t¹¹+t¹⁰c¹²) of more than 3:1, preferable more than 5:1, most preferable more than 7.5:1 as measured by ^{13}C -magnetic resonance technology.
8. Food products, preferably selected from the group consisting of confectionery products, spreads, sauces, dressings, mayonnaise, ice cream, doughs, baked bakery products, fillings, creams containing an effective amount of a composition comprising 1 to 100 wt% of tt-CLA, preferably in the form of a mono- and/or di- and/or triglyceride and most preferably containing an effective amount of the composition according to claims 5 to 7.
9. Food supplements containing an effective amount of a composition comprising 1 to 100 wt% of tt-CLA, preferably

containing an effective amount of a composition according to claims 5 to 7.

10. Food supplements according to claim 9 wherein the tt-CLA rich composition is encapsulated in a food grade encapsulating material.

11. Food supplement according to claims 9 to 10 wherein the composition comprising the tt-CLA is fortified with other food ingredients selected from the group consisting of vitamins A, B, C, D, E, K, minerals such as calcium, potassium, magnesium, iron, copper, zinc, selenium and anti-oxidants such as tocopherols, polyphenols.

12. Process for the preparation of a composition according to claims 5 to 7, wherein:

i) a composition with a total unconjugated C18:2 content of more than 55 wt% is conjugated and isomerized by subjecting it to a catalytic treatment with a Sulphur-Nickel catalyst at a temperature of 100 to 180 °C in the absence of hydrogen

ii) the product formed in step i) is subjected to a solvent fractionation using acetone in a weight ratio of acetone to CLA product of 10:1 to 1:1 at a temperature of -25 to -100 °C, whereupon a stearine (or top) fraction is isolated as product according to claims 5 to 6.

13. Process for the enrichment of a mixture comprising different isomers of conjugated linoleic acid in the tt-CLA isomers wherein a mixture comprising at least 1 wt% of tt-CLA in admixture with other CLA isomers is subjected to an enzymic conversion, selected from the group consisting of i) partial hydrolysis of a glyceride mixture or of a mixture of esters of short chain alcohols, ii) partial esterification of a mixture of free fatty acids with glycerol or with a glyceride, iii) partial glycerolysis of a glyceride mixture and iv) partial esterification of an alcohol with free CLA isomers, while using an enzyme that can discriminate tt-CLA from other CLA isomers, whereupon the reaction product is separated by physical means separating a fraction that is enriched in tt-CLA as reaction product.

14. Process according to claim 13 wherein the enzyme is selected from the group consisting of: Candida rugosa lipase, Lipase QL, Lipase SL, Lipase OF, Geotrichum candidum B lipase, Lipozyme IM and Lipozyme M.

Patentansprüche

1. Verwendung einer Mischung zur Herstellung eines Nahrungsmittels oder eines Nahrungsmittelzusatzes, worin eine Mischung, die, gemessen mit ^{13}C -Magnetresonanz, 1 bis 100, vorzugsweise 5 bis 90, am bevorzugtesten 20 bis 85 Gewichts% (basierend auf der Gesamtmischung) an Isomeren von trans/trans konjugierter Linolsäure (=tt-CLA) enthält, zur Herstellung eines Nahrungsmittels oder Nahrungsmittelzusatzes mit anti-inflammatorischen Eigenschaften eingesetzt wird.

2. Verwendung einer Mischung gemäss Anspruch 1, worin die Mischung, die die tt-CLA enthält, zur Herstellung eines Nahrungsmittelzusatzes in eingekapselter Form eingesetzt wird.

3. Verwendung einer Mischung gemäss Anspruch 1 und 2, worin die Mischung, die die tt-CLA-Isomere enthält, einen mit ^{13}C -Magnetresonanstechnik gemessenen Gehalt an tt-CLA von 5 bis 90 Gewichts% (der Gesamtmischung) aufweist, wobei ebenfalls die CLA-Isomeren cis⁹trans¹¹ und trans¹⁰cis¹² in einem Gewichtsverhältnis von (Gesamt t⁹t¹¹ + t¹⁰t¹²) : (c⁹t¹¹ + t¹⁰c¹²) von mehr als 3:1, vorzugsweise mehr als 5:1, am bevorzugtesten von mehr als 7,5:1, vorliegen.

4. Verwendung einer Mischung gemäss Anspruch 1 bis 3, worin die tt-CLA-Isomeren entweder als freie Fettsäuren oder als Mono-, Di- und/oder Triglyceride oder als Alkylester eingesetzt werden.

5. Mischung mit anti-inflammatorischen Eigenschaften, enthaltend CLA-Isomere worin die Mischung mehr als 10 Gewichts%, vorzugsweise mehr als 25 Gewichts%, ganz besonders bevorzugt mehr als 50 Gewichts% CLA-Isomere enthält, von denen mehr als 55, vorzugsweise mehr als 60, besonders bevorzugt mehr als 65 Gewichts% (der gesamten CLA-Isomeren) tt-CLA-Isomere sind, gemessen mit ^{13}C -Magnetresonanstechnik.

6. Mischung mit anti-inflammatorischen Eigenschaften gemäss Anspruch 5, worin die Mischung die tt-CLA-Isomeren t⁹t¹¹ und t¹⁰t¹² in einem Gewichtsverhältnis von t⁹t¹¹:t¹⁰t¹² von weniger als 2,3:1, vorzugsweise weniger als 1,8:1, am meisten bevorzugt weniger als 1,0:1 enthält, gemessen mit ^{13}C -Magnetresonanstechnik.

7. Mischung gemäss Anspruch 5 oder 6, worin die Mischung auch c^9t^{11} - und $t^{10}c^{12}$ -CLA-Isomere in einem Gewichtsverhältnis von (Gesamt $t^9t^{11} + t^{10}t^{12}$) : ($c^9t^{11} + t^{10}c^{12}$) von mehr als 3:1, vorzugsweise mehr als 5:1, am meisten bevorzugt mehr als 7,5:1 enthält, gemessen mit ^{13}C -Magnetresonanstechnik.
- 5 8. Nahrungsmittel, vorzugsweise ausgewählt aus Konditoreiwaren, Brotaufstrichen, Saucen, Salatsaucen, Mayonnaise, Speiseeis, Teig, gebackene Backwaren, Füllungen und Cremes, enthaltend eine wirksame Menge einer Mischung, die 1 bis 100 Gewichts% tt-CLA enthält, vorzugsweise in Form eines Mono- und/oder Di- und/oder Triglycerids, am meisten bevorzugt enthaltend eine wirksame Menge einer Mischung gemäss Anspruch 5 bis 7.
- 10 9. Nahrungsmittelzusatz, enthaltend eine wirksame Menge einer Mischung, die 1 bis 100 Gewichts% tt-CLA enthält, vorzugsweise enthaltend eine wirksame Menge einer Mischung gemäss Anspruch 5 bis 7.
10. Nahrungsmittelzusatz gemäss Anspruch 9, worin die an tt-CLA reiche Mischung in einem in Nahrungsmittel zugelassenen Mittel zur Einkapselung eingekapselt ist.
- 15 11. Nahrungsmittelzusatz gemäss Anspruch 9 und 10, worin die tt-CLA enthaltende Mischung mit anderen Nahrungsmittelbestandteilen, ausgewählt aus den Vitaminen A, B, C, D, E und K, Mineralien, wie Kalzium, Kalium, Magnesium, Eisen, Kupfer, Zink, Selen und Antioxidantien, wie Tocopherole und Polyphenole, verstärkt ist
- 20 12. Verfahren zur Herstellung einer Mischung gemäss Anspruch 5 bis 7, worin
- i) eine Mischung mit einem Gesamtgehalt an unkonjugiertem C18:2 von mehr als 55 Gewichts% durch katalytische Behandlung mit einem Schwefel-Nickel-Katalysator bei einer Temperatur von 100 bis 180°C in Abwesenheit von Wasserstoff konjugiert und isomerisiert wird,
- 25 ii) das in Schritt i) gebildete Produkt einer Lösungsmittel-Fraktionierung mit Aceton in einem Gewichtsverhältnis von Aceton zu CLA-Produkt von 10:1 bis 1:1 bei einer Temperatur von -25 bis -100°C unterworfen wird, worauf eine Stearin-(oder Kopf)-Fraktion als Produkt gemäß Anspruch 5 bis 6 isoliert wird.
- 30 13. Verfahren zur Anreicherung der tt-CLA-Isomeren in einem Gemisch, das verschiedene Isomere von konjugierter Linolsäure enthält, wobei ein Gemisch, das mindestens 1 Gewichts% an tt-CLA in Beimischung mit anderen CLA-Isomeren enthält, einer enzymatischen Umwandlung unterworfen wird, welche ausgewählt ist aus i) partieller Hydrolyse eines Glycerid-Gemisches oder eines Gemisches von Estern mit kurzkettigen Alkoholen, ii) partieller Veresterung eines Gemisches von freien Fettsäuren mit Glycerol oder einem Glycerid, iii) partieller Glycerolyse eines Glyceridgemisches und iv) partieller Veresterung eines Alkohols mit freien CLA-Isomeren, wobei ein Enzym verwendet wird, welches tt-CLA von anderen CLA-Isomeren unterscheiden kann, und danach das Reaktionsprodukt mit physikalischen Methoden abgetrennt wird, wobei eine Fraktion als Reaktionsprodukt abgetrennt wird, welche mit tt-CLA angereichert ist.
- 35 14. Verfahren nach Anspruch 13, worin das Enzym ausgewählt ist aus Lipase von *Candida rugosa*, Lipase QL, Lipase SL, Lipase OF, Lipase von *Geotrichum candidum* B, Lipozym IM, Lipozym M.
- 40

Revendications

- 45 1. Utilisation d'une composition pour la production d'un produit alimentaire ou d'un complément alimentaire dans laquelle une composition comprenant de 1 à 100, de préférence de 5 à 90, plus préférentiellement de 20 à 85 % en poids (sur la base de la composition totale) d'isomères trans-trans d'acide linoléique conjugué (tt - CLA), tel que mesuré par résonance magnétique ^{13}C , est utilisée pour la production d'un produit alimentaire ou d'un complément alimentaire ayant des propriétés anti-inflammatoires.
- 50 2. Utilisation d'une composition selon la revendication 1, dans laquelle la composition comprenant les isomères trans-trans d'acide linoléique conjugué est appliquée pour la production d'un complément alimentaire sous une forme encapsulée.
- 55 3. Utilisation d'une composition selon les revendications 1 et 2, dans laquelle la composition comprenant les isomères trans-trans d'acide linoléique conjugué, contient tel que mesuré par les techniques de résonance magnétique ^{13}C de 5 à 90 % en poids (sur la base de la composition totale) d'isomères trans-trans d'acide linoléique conjugué, alors qu'également les isomères cis $^9trans^{11}$ et $trans^{10}cis^{12}$ d'acide linoléique conjugué sont présents dans un

rapport en poids entre $t^{9t11} + t^{10t12}$ total) et $(c^{9t11} + t^{10c12})$ est supérieur à 3 pour 1, de préférence il est supérieur à 5 pour 1, de la façon la plus préférentielle il est supérieur à 7,5 pour 1.

4. Utilisation d'une composition selon les revendications 1 à 3, dans laquelle les isomères trans-trans d'acide linoléique conjugué sont appliqués soit sous la forme d'acides gras libres, ou de mono glycérides, de diglycérides et/ou de triglycérides, ou sous la forme d'alkyl esters.
5. Composition ayant des propriétés anti-inflammatoires comprenant des isomères d'acide linoléique conjugué, dans laquelle la composition comprend plus de 10 % en poids, de préférence plus de 25 % en poids, de la manière la plus préférentielle plus de 50 % en poids d'isomères d'acide linoléique conjugué parmi lesquels plus de 55, de préférence plus de 60, de la manière la plus préférée plus de 65 % en poids (sur la base du total des isomères d'acide linoléique conjugué) sont des isomères trans-trans d'acide linoléique conjugué, tel que mesuré par les techniques de résonance magnétique ^{13}C .
6. Composition ayant des propriétés anti-inflammatoires selon la revendication 5, dans laquelle la composition comprend les isomères trans-trans d'acide linoléique conjugué t^{9t11} et t^{10t12} dans un rapport en poids entre t^{9t11} et t^{10t12} inférieur à 2,3 pour 1, de préférence inférieur à 1,8 pour 1, plus préférentiellement inférieur à 1,0 pour 1 (tel que mesuré par les techniques de résonance magnétique ^{13}C).
7. Composition selon les revendications 5 ou 6, dans laquelle la composition contient également des isomères c^{9t10} et t^{10c12} d'acide linoléique conjugué dans un rapport en poids entre $(t^{9t11} + t^{10t12})$ total et $(c^{9t10} + t^{10c12})$ supérieur à 3 pour 1, de préférence supérieur à 5 pour 1, plus préférentiellement supérieur à 7,5 pour 1, tel que mesuré par la technologie de résonance magnétique ^{13}C .
8. Produits alimentaires, de préférence sélectionnés à partir du groupe constitué des produits de confiserie, des pâtes à tartiner, des sauces, des vinaigrettes, de la mayonnaise, des crèmes glacées, des pâtes, des produits de boulangerie cuits, des garnitures, des crèmes contenant une quantité effective d'une composition comprenant de 1 à 100 % en poids d'isomères trans-trans d'acide linoléique conjugué, de préférence sous la forme d'un monoglycéride, d'un diglycéride et/ou d'un triglycéride et, de la manière la plus préférée, contenant une quantité effective de la composition selon les revendications 5 à 7.
9. Compléments alimentaires contenant une quantité effective d'une composition comprenant de 1 à 100 % en poids d'isomères trans-trans d'acide linoléique conjugué, contenant de préférence une quantité effective d'une composition selon les revendications 5 à 7.
10. Compléments alimentaires selon la revendication 9, dans lesquels la composition riche en isomères trans-trans d'acide linoléique-conjugué est encapsulée dans un matériau d'encapsulation de qualité alimentaire,
11. Complément alimentaire selon les revendications 9 à 10 dans lequel la composition comprenant les isomères trans-trans d'acide linoléique conjugué est fortifiée avec d'autres ingrédients alimentaires sélectionnés à partir du groupe constitué des vitamines A, B, C, D, E, K, des minéraux tels que le calcium, le potassium, le magnésium, le fer, le cuivre, le zinc; le sélénium, et les anti-oxydants tels que les tocophérols et les polyphénols.
12. Procédé de préparation d'une composition selon les revendications 5 à 7, dans lequel:
 - i) une composition contenant au total une teneur en $C_{18:2}$ non conjugué supérieure à 55 % en poids est conjuguée et isomérisée en la soumettant à un traitement catalytique avec un catalyseur soufre-nickel à une température de 100 à 180°C en l'absence d'hydrogène ;
 - ii) le produit formé dans le cadre de l'étape i) est soumis à un fractionnement au solvant en utilisant de l'acétone dans un rapport en poids entre l'acétone et le produit d'acide linoléique conjugué allant de 10 pour 1 à 1 pour 1 à une température allant de 25 à - 100°C, suite à quoi on isole une fraction (ou couche supérieure) de stéarine en tant que produit en accord avec la présente invention.
13. Procédé d'enrichissement d'un mélange comprenant différents isomères d'acide linoléique conjugué dans les isomères trans-trans d'acide linoléique conjugué, dans lequel un mélange comprenant au moins 1 % en poids d'isomères trans-trans d'acide linoléique conjugué en mélange avec d'autres isomères d'acide linoléique conjugué est soumis à une conversion enzymatique sélectionnée à partir du groupe constitué de i) l'hydrolyse partielle d'un mélange de glycéride ou d'un mélange, d'esters d'alcools à chaîne courte, ii) l'estérification partielle d'un mélange

d'acides gras libres avec du glycérol ou avec un glycéride, iii) la glycérolyse partielle d'un mélange de glycéride et iv) l'estérification partielle d'un alcool avec des isomères d'acide linoléique conjugué libre, tout en utilisant une enzyme capable de discriminer les isomères trans-trans des autres isomères d'acide linoléique conjugué, suite à quoi le produit de réaction est séparé par des moyens physiques en séparant une fraction qui est enrichie en isomères trans-trans d'acide linoléique conjugué en tant que produit de réaction

14. Procédé selon la revendication 13, dans lequel l'enzyme est sélectionnée à partir du groupe constitué de : la lipase *Candida rugosa*, la Lipase QL, la Lipase SL, la Lipase OF, la lipase B de *Geotrichum candidum*, le Lypozyme IM et le Lypozyme M.
